

Test Taking Tips:

- **Rearrange then replace**
 - When a problem asks you to find a variable not already solved for (such as D in $L = \sqrt{4Dt}$) rearrange the problem before inserting the numbers
 - This keeps things cleaner for you and your grader to see → less mistakes, more partial credit
- **Convert**
 - Make sure to write down your units and properly convert them *before* putting them into your equation so as to best avoid any confusion
 - Again cleaner
- **Vocabulary**
 - Know your terms! The better you know the proper scientific terms the better and more concisely you can explain concepts asked of you
 - Saves you time, makes your answers more correct
- **Visualize**
 - If the situation described does not make sense to you, draw a picture! Concepts discussed in class have to do with physical properties, so draw them
 - This may make things more clear, meaning you use the numbers given correctly
- **Read carefully**
 - Seems obvious, but questions asked of you may very well have a “trick” to them (such as giving you the length to the diameter when you need to use a radius)
 - Making careless mistakes is the worst, so don’t let it happen to you
- **Legibility is key**
 - You may feel pressed for time, but slow down and write legibly
 - If you can barely read it, assume your graders cannot
 - Going slightly slower also helps prevent mistakes
- **Breathe**
 - It’s one test, no worries
 - Nothing blocks up the brain more than panic, so just inhale, exhale, and you *won’t fail!* Trust us, we aren’t looking to make your life impossible...
