

Claude Code — commands worth knowing

A short reference to the commands most useful in everyday work.

Type `/` in a session to see what's available. A command is only recognized at the **start** of a message; text after it is passed as arguments.

Notation: `<arg>` = required · `[arg]` = optional.

COMMAND	WHAT IT DOES
<code>/init</code>	Generate a starter <code>CLAUDE.md</code> for a repo so Claude understands the project. Run this first in any new codebase.
<code>/compact [instructions]</code>	Summarize the conversation to free up context without losing the thread . Optionally focus the summary.
<code>/context [all]</code>	Visualize where your context window is going, with warnings and optimization tips. Pair with <code>/compact</code> .
<code>/rewind</code>	Roll code and/or conversation back to an earlier checkpoint, or summarize from a point. aliases: <code>/checkpoint</code> · <code>/undo</code>
<code>/resume [session]</code>	Return to an earlier conversation by ID/name, or open the picker. alias: <code>/continue</code>
<code>/branch [name]</code>	Fork the current conversation, preserving the original to return to later. alias: <code>/fork</code>
<code>/btw <question></code>	Ask a quick side question without bloating the main conversation history.
<code>/usage</code>	Session cost, plan limits, and activity stats. aliases: <code>/cost</code> · <code>/stats</code>
