

DAY 2 · CHEAT CARD

terminal-refresher

macOS · Terminal (zsh / bash)

pwd

Print the current folder you're in.

ls

List files and folders here.

cd folder

Change into a folder by name.

cd ..

Move up one folder.

cd ~

Jump to your home folder.

mkdir name

Make a new folder.

git clone url

Download a project into the current folder.

DAY 2 · CHEAT CARD

terminal-refresher

Windows · PowerShell

Get-Location · pwd

Print the current folder you're in.

Get-ChildItem · ls · dir

List files and folders here.

cd folder

Change into a folder by name.

cd ..

Move up one folder.

cd ~ · cd \$HOME

Jump to your home folder.

mkdir name

Make a new folder.

git clone url

Download a project into the current folder.

ONE HOME FOR YOUR CODE

Make a single folder — e.g. **~/Development** on macOS or **C:\Users\you\Development** on Windows — and **cd** into it before every **git clone**. That way every project lives in one predictable place. **git** must be installed first (mac: *brew install git* · windows: *git-scm.com/download*).
